Not illustrated. 1899 Excerpt: . master controller or operator s switch mounted on a standard, and fastened to the wood work of the cab. Through this master controller the pilot apparatus of the current varying controller and the reversers are governed. It is provided with a movable handle, operating a spring retracted spindle, which through various degrees of movement makes contact with the reverser circuit and with three determinate positions, coast. series, and multiple. Momentary contacts on these various points give any desired intermediate position of the main controller, which has a stepped movement. In order to maintain the controller at any point, or to keep the governing circuits or train lines energized, the handle of the master controller must be held in position. If the handle is released, whether from accident or design, the spindle instantly returns to coast position, and the controller automatically returns to the off position and cuts off the current, or if the master controller is allowed to go to the center position, the reverser is instantly opened, and the controller then comes to open circuit also automatically. The arrangement of circuits is such that by the Use of a relay and throttle and the proper interconnection between the controlling circuits the operator is at liberty to do about as he pleases with the master controller, and can rely upon the main controller operating satisfactorily. For example: He can go to the series or to the multiple position, or, from the last, reverse movement instantly,...
